

## Kanapy texture module: elements

ODF: orientation distribution function

MDF: misorientation distribution function

## Example

- 316L stainless steel
- Single phase: Austenite
- Number of grains: 197

Biswas et. al. 2020

# Kanapy geometry module

```
(knpy) $ kanapy genStats -f stat_input.json
```

- Shows the probability density functions

```
(knpy) $ kanapy genRVE -f stat_input.json
```

- Creates json files consisting of grain dimensions

(knpy) \$ kanapy pack

```
(knpy) $ kanapy voxelize
```

```
(knpy) $ kanapy abaqusOutput
```

```
(knpy) $ kanapy outputStats
```

```
(knpy) $ kanapy plotStats
```

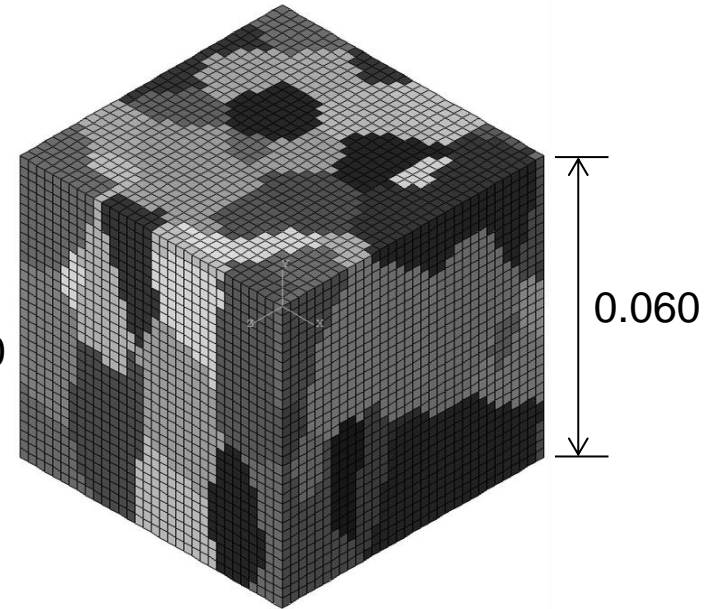

## Exercise: geometry module

- Change the parameters controlling the RVE dimensions and use genRVE

```
"RVE":
{
  "sideX": ...,
  "sideY": ...,
  "sideZ": ...,
  "Nx": ..,
  "Ny": ..,
  "Nz": ..
}
```

- Hint: start by changing the side length of the RVE

85 grains

## Kanapy texture module: ODF reconstruction

- Essential inputs :
  - Crystallographic orientation: EBSD (\*.mat file)

```
$ kanapy reduceODF -ebsd <.mat>
```

- Kernel halfwidth
  - Grains as (\*.mat file) –grains <\*.mat>
  - Option –kernel <halfwidth in radians>
- Provide integer value for number of orientations
- Refer \*.log file for status

## Exercise: texture reconstruction

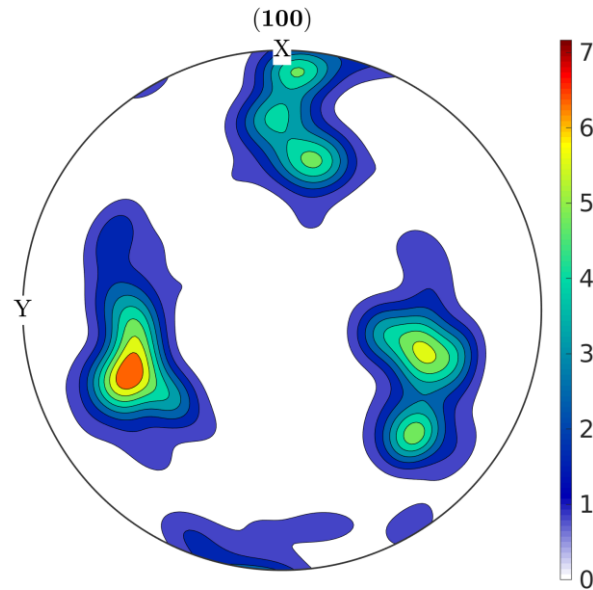

- Make reduced reconstruction with 40 discrete orientations
- What happens to  $\|f - \tilde{f}\|_1$  as the number of discrete orientations ( $\tilde{N}$ ) increase ?

# Exercise: Solution

ODF (EBSD)

$\tilde{N} = 40$

$\tilde{N} = 70$

# Exercise: Solution

## Kanapy texture module: MDF reconstruction

- Focuses on misorientation angle distribution
- Systematic assignment of crystallographic orientation

```
(knpy) $ kanapy reduceODF -ebsd ebsd_316L.mat -grains  
grains_316L.mat -fit_mad yes
```

## Kanapy texture module: MDF reconstruction

➤ Option

(knp) \$ Will generate <N> reduced orientations, continue(yes/no):

- Generates discrete orientations (ODF reconstruction)

(knpy) \$ Please provide the number of bins required for MDF fitting  
(integer, Default=13):

- Provide the resolution of misorientation angle distribution

```
(knpy) $ Found a shared surface area file in the current directory
under: '/json_files', continue(yes/no):
```

- Looks for the grain boundary shared surface are file

## Kanapy texture module: MDF reconstruction

(knpy) \$ During MAD fitting, grain orientations can be weighted based on their volumes. This option required (yes/no):

- Corrects the ODF of represented by the synthetic microstructure due to grain size distribution

## Exercise: MDF

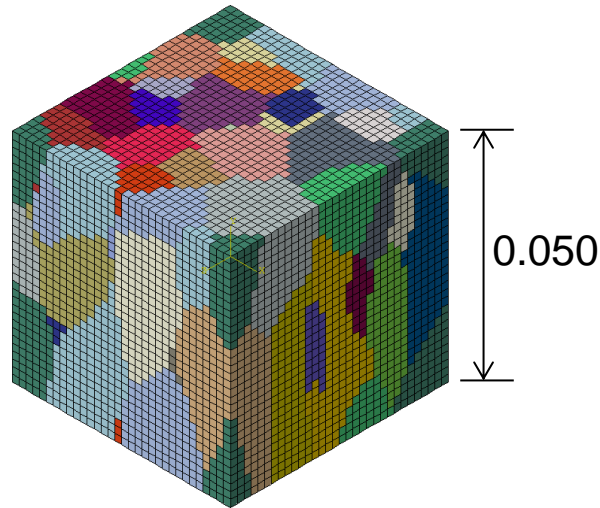

- Increase RVE dimensions to include more grains and perform the MDF fitting

# Example: Solution

40 grains

62 grains

85 grains
